

Towards a Hydrogen Economy

S.A. Sherif, F. Barbir and T.N. Veziroglu

From electrolysis and thermolysis to production from biomass, hydrogen production methods are falling to place. So is storage, via all modes of gaseous, liquid, slush, and metal hydride systems. But proponents need to address the perception that hydrogen poses a severe safety risk, since the evidence suggests its risks are the same order of magnitude as gasoline or natural gas.

S.A. Sherif is a Professor of Mechanical and Aerospace Engineering and is Assistant Director of the Industrial Assessment Center and Founding Director of the Wayne K. and Lyla L. Masur HVAC Laboratory at the University of Florida in Gainesville.

Franco Barbir is Professor-in-Residence at the Connecticut Global Fuel Cell Center at the University of Connecticut in Storrs. Prior to joining UConn in 2003, Dr. Barbir served as Director of Fuel Cell Technology and Chief Scientist at Proton Energy Systems in Wallingford, Connecticut, and Vice President of Technology and Chief Scientist at Energy Partners, West Palm Beach, Florida.

T.N. Veziroglu is a Professor and Director of the Clean Energy Research Institute at the University of Miami in Coral Gables, Florida.
